INTRODUCTION

This study was conducted for the International Hunter Education Association in conjunction with the North Carolina Wildlife Resources Commission, the Vermont Fish and Wildlife Department, to gather data about elevated stand accidents. The study entailed a telephone survey of hunters in North Carolina and Vermont. In the study, 536 hunters from North Carolina were interviewed, and 520 hunters from Vermont were interviewed, for a total of 1,056 hunters. The survey was administered in July 2002.

OVERVIEW

Only a few hunters (7%) who use elevated hunting stands had actually experienced an accident, and only 22% of those who had experienced an accident had required any medical treatment.

Most hunters who had experienced an accident had not used a fall-restraint device. Typically, hunters who had experienced an accident had been climbing into or out of their elevated hunting stand when the accident occurred. Most elevated stand accidents occurred in daylight and in clear weather.

Most hunters had taken a hunter safety course, but roughly half the courses did not address elevated hunting stand safety. Although a strong majority of hunters indicated that they were concerned about elevated hunting stand safety, most hunters indicated that it was not likely they would be injured in an elevated stand accident. Most hunters who had been involved in an accident felt that they did not take as many precautions as they could have to prevent the accident.

Most elevated hunting stands that were in use at the time of an accident did not have a shooting or safety rail. In addition, most hunters who had been involved in an accident said that their elevated stand was not defective.

Most hunters who had been involved in an accident changed their hunting techniques after the accident.

A complete discussion of the survey results follows.

SURVEY RESULTS

TYPE OF FIREARM AND METHOD FOR GETTING IT INTO THE ELEVATED HUNTING STAND

Q7. Most hunters use either a rifle (47%) or a bow (42%) to hunt from an elevated hunting stand, with North Carolina hunters slightly more likely to use a rifle, and Vermont hunters slightly more likely to use a bow.

Q8. Most hunters get their hunting equipment into the elevated hunting stand using a rope (79%), although many carry the firearm or bow over the shoulder or back with a sling (16%). Very few (3%) carry the firearm or bow by hand while climbing into the elevated hunting stand.

Q7. What type of hunting equipment do you use most often while hunting from an elevated hunting stand?

Q8. How do you get your equipment (bow, rifle, shotgun, etc.) into the elevated hunting stand most often?

CERTIFICATION COURSES

Q9. The survey indicated that 63% of hunters had taken a hunter certification course, with Vermont hunters having a higher rate of attendance than do North Carolina hunters (72% of Vermont hunters had taken a hunter certification course; 54% of North Carolina hunters had taken a course).

Q10. Of those who had taken a course, 49% indicated that the course did not include instructions on how to use an elevated hunting stand.

Q9. Have you ever taken a hunter safety certification course?

**Q10. In the hunter safety certification course you took, was there instruction on using an elevated hunting stand?
(Asked of those who took a hunter safety education course)**

CONCERN ABOUT ELEVATED HUNTING STAND SAFETY, REASONS FOR ACCIDENTS, AND PERCEIVED LIKELIHOOD THAT AN ACCIDENT WILL OCCUR

Q11. A large majority (80%) of those surveyed indicated that they were either somewhat or very concerned about elevated hunting stand safety while hunting from an elevated hunting stand.

There was no relationship [$\chi^2(6, n=1056) = 2.70, p = .85$] between the level of concern while hunting from an elevated hunting stand and having attended a hunter certification course. There also was not a significant relationship [$\chi^2(6, n=663) = 5.28, p = .51$] between concern and instruction at a certification course on using an elevated hunting stand.

Q13. When asked to name the main reasons they believed elevated stand hunting accidents occur, hunters said carelessness (57%), poor judgment (16%), lack of familiarity with equipment (13%), lack of sleep (11%), and equipment failure (11%).

Q15. Over half (52%) of all respondents think that hunters practice unsafe behaviors or methods while elevated stand hunting because hunters believe an accident will not happen to them.

Q17. In follow up to the question about why hunters practice unsafe behaviors, the survey asked respondents to indicate the likelihood that they would be injured in a fall from an elevated hunting stand, and 79% indicated that they were not at all likely to be injured in a fall from an elevated hunting stand in the next 2 years.

It is of interest that 2% of all hunters indicated that they thought that it is very likely that they will be injured in a fall in the next 2 years, and 1.5% percent of all hunters *have* been injured in an elevated hunting stand (as defined by having an accident and needing some medical attention).

A reexamination of these data shows that there is no significant [$\chi^2(2, n=72) = .435, p = .804$] difference among those who *had* been injured and those who *had not* been injured in an accident in the past 10 years and their anticipation of being injured in future accidents. This would seem to indicate that a hunter's attitude about the likelihood of having future accidents is not swayed in an obvious manner by experiencing an actual accident.

Q11. How concerned are you with elevated hunting stand safety while hunting from a elevated stand? Would you say you are very concerned, somewhat concerned, or not at all concerned with elevated stand safety while hunting from an elevated stand?

Q13. In your opinion, what are the main reasons for elevated stand hunting accidents?

Multiple Responses Allowed

Q15. Why do you think some hunters practice unsafe behaviors or methods while elevated stand hunting? Do you think it is because...

Q17. How likely do you think it is that you will be injured in a fall while using an elevated hunting stand in the next 2 years?

ACCIDENT RATES

Q18. Few hunters (7%) had experienced an accident in an elevated hunting stand in the previous 10 years.

Q19. Of those 76 respondents who had experienced an accident in the previous 10 years, 8% (6 respondents) had experienced more than one accident in the previous 10 years.

Q23. The years that the most recent accidents had occurred are shown, as well.

Q111. None of the accidents discussed in this survey had been investigated by a governmental agency.

Q18. Have you experienced an accident in an elevated hunting stand within the past 10 years?

**Q19. What is the total number of accidents you've experienced in an elevated hunting stand within the past 10 years?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q23. In what year did the most recent accident occur?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q111. Was the most recent accident investigated by any governmental agency?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

INJURIES AND COSTS

For Questions 22-116, respondents discussed their most recent accident, which for most was their only accident. Therefore, all statistics in the following section do not include the second accident that 6 hunters had experienced.

Q22. Fortunately, a large majority (78%) of those hunters who had been involved in an elevated hunting stand accident had not been injured. Only 22% had needed any type of medical attention as a result of their fall, with 11% having received treatment from a medical professional, and 11% having received treatment, but not from a medical professional. In terms of the entire sample, 1.5% of all hunters interviewed had experienced an elevated hunting stand accident *and* had needed medical attention.

Q42-Q44. Few hunters (11%) indicated that their accident had incurred a cost (medical costs, rehabilitative costs, or lost wages). Of those 8 respondents who had experienced an accident that incurred a cost, the mean total cost was \$7,506, broken down as follows: \$5,294 in medical costs, \$1,013 in rehabilitation costs, and \$1,200 in lost wages.

**Q22. Did the most recent accident require any professional medical treatment?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Accidents (most recent) that incurred any cost.
(Calculated for those who indicated that they had
experienced an elevated hunting stand accident in
the past 10 years)**

**Mean cost of those accidents (most recent) that incurred a cost.
(Calculated for those who indicated that they had experienced an elevated stand accident in the past 10 years that incurred a cost)**

CHARACTERISTICS OF ELEVATED HUNTING STANDS, HUNTING EQUIPMENT, AND ACTIONS AT TIME OF ACCIDENT

For Questions 22-116, respondents discussed their most recent accident, which for most was their only accident. Therefore, all statistics in the following section do not include the second accident that 6 hunters had experienced.

Q46. Most accidents occurred while the hunter was using either a climbing (43%) or fixed position (34%) elevated stand. Ladder elevated stands accounted for 18% of the accidents reported in the survey, and tripod or quad elevated stands accounted for only 4% of accidents.

Q24. The hunting equipment most respondents indicated that they had been using at the time of the accident was a bow (54%) followed by a rifle (25%), with a large variation among states. Among North Carolina hunters, 39% had been using a rifle and 35% had been using a bow when the accident occurred; among Vermont hunters, 89% had been using a bow at the time of the accident, and 0% had been using a rifle (the next most given answer among Vermont hunters was muzzleloader, at 7%).

Q25. Most hunters had not used a fall-restraint device of any sort (58%) when the accident occurred. Q27 and Q28. Additionally, 78% had not used a fall-restraint device while climbing into the elevated hunting stand, and 51% had not used a fall-restraint device while in the elevated hunting stand.

There was not a significant relationship between the use of a restraint on the day of the accident and the necessity for medical attention [$\chi^2(1, n=75) = .985, p = .321$]. There was also no

relationship between the necessity for medical attention and the use of a restraint while climbing into the stand [$\chi^2(1, n=74) = .44, p = .507$], nor was there a relationship between the necessity for professional medical attention and the use of a restraint while in the stand [$\chi^2(2, n=75) = .648, p = .723$].

Q33. Hunters who had experienced an elevated hunting stand accident indicated that they had been climbing into hunting position (32%) or getting down from the elevated stand (29%). Looking at the same data in a different manner shows that 36% of the accidents happened while the hunter was transitioning into the elevated hunting stand, and 38% percent of the accidents happened while the hunter was transitioning out of the elevated hunting stand. In total, 74% of all elevated hunting stand accidents reported by the hunters in this study occurred while transitioning into or out of the elevated hunting stand, not while already in the stand, while setting up the stand, or doing anything else (Q36, in fact, no accidents occurred while the hunter was shooting at game).

Q60, Q78, Q95, and Q109. Hunters who had experienced accidents named the reasons that may have contributed to their accidents (there is a separate graph for each type of elevated stand). Carelessness and lack of sleep were two important reasons; however, most respondents indicated that none of the reasons listed were contributing factors to the accident.

Q40. The survey asked those who had experienced an accident about the direct causes of their injury. Of those, 24% said that they fell onto the ground, 13% said they were caught on the steps

while falling, 1% said they were injured by the safety harness or belt, and 29% answered “other” when asked to describe the direct cause of their injury.

Q45. Most accidents (53%) occurred while the elevated hunting stand was at a height of between 6 and 15 feet from the ground. Stand height also did not appear to be related to severity of injury, whether looking at the need for professional medical attention ($\underline{M}=16.75$, $\underline{SD}=8.35$) versus lack of need for attention ($\underline{M}=13.24$, $\underline{SD}=7.36$) as the independent variable and testing for differences in the heights (using the means-by-midpoint method) [$F(1,74) = 1.582$, $p = .212$] or whether examining the same data as relationship between heights and total amount of money spent on the injury ($r(76) = -.024$, $p = .836$).

All data regarding stand construction, stand defects, presence or absence of a safety or shooting rail, types of stand attachments, and hunters’ heights, weights, and ages have been summarized across all types of elevated stands.

Q53, Q69, Q86, and Q103. Most elevated stands (70%) that were used by the 76 hunters who had been involved in an elevated hunting stand accident in the past 10 years did *not* have a safety or shooting rail. Hunters who had been involved in a fall from an elevated hunting stand indicated that a significantly [$\chi^2(1, n=72) = 5.696$, $p < .05$] greater proportion of manufactured stands (80%) did not have a shooting rail compared to homemade stands (52%).

Q47, Q62, Q80, and Q97. Most elevated hunting stands used by hunters who had an accident in the past 10 years were manufactured (68%) and were metal (60%). Additionally, 51% of the elevated stands were both manufactured *and* metal.

Q49, Q65, Q82, and Q99. Most hunters (79%) who had been in an elevated hunting stand accident in the past 10 years, indicated that their elevated stand had *not* been defective at the time of the accident.

Q51. Three hunters had been involved in an accident while hunting from a defective ladder elevated hunting stand, with the cause being that a step broke, the brace to the tree gave way, or the attachment of the platform broke.

Q64. The types of fixed position elevated hunting stands that had been involved in an accident were broken down as follows: 27% were permanent, and 73% were portable or hang-on type.

Q67. Six hunters had been involved in an accident while hunting from a defective fixed position elevated hunting stand, with the cause being that a step broke, the brace to the tree gave way, the attachment of the platform broke, or the shooting rail broke.

Q72. Of those 26 respondents who had been involved in an elevated hunting stand accident and had been using a fixed position elevated hunting stand, 54% of the hunters used screw in steps, 15% used wooden steps, and 19% used tree limbs to access the stand.

Q84. Six hunters, all from North Carolina, had been involved in an accident while hunting from a defective climbing elevated hunting stand, with the stated causes being that the attachment of the platform broke, the foot climber broke, the safety keys came out of position, or that the stand was too heavy and pulled away from the tree (i.e., faulty design).

Q89. Of those who had been in an accident involving a climbing elevated hunting stand, 42% indicated that the accident occurred while they were climbing up the tree, and 33% indicated that they were climbing down the tree when the accident occurred. Only 9% said that they were in shooting position when the accident occurred.

Q101. One hunter, who was from Vermont, had been involved in an accident while hunting from a defective tripod or quad elevated hunting stand, with the stated cause being that the stand was old.

Q54, Q70, Q87, and Q104. It should be noted that considerable liberty was taken in constructing the data regarding type of elevated hunting stand attachment. Fastening devices were loosely categorized as nailed, screwed (including wingbolt and blade with nut), and looped (including any flexible method of encircling branches or the tree, such as straps, cables, chains, ropes, and ratchets). Anything that did not fit those categories was not included. The results show that 46% of hunters used screwed attachments, 30% used looped attachments, and 9% used nailed attachments. There was considerable variation between the two states: North Carolina hunters used screwed attachments at a higher rate than did Vermont hunters (58% of North Carolina hunters, 19% of Vermont hunters); Vermont hunters used looped attachments at a higher rate than did North Carolina hunters (44% of Vermont hunters, 24% of North Carolina hunters).

**Q46. What type of elevated hunting stand were you using when the most recent accident occurred?
 (Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

Q24. Please identify the hunting equipment you were using at the time of the most recent accident. (Asked of those who indicated that they had experienced a elevated hunting stand accident in the past 10 years)

Q25. What kind of fall-restraint device did you use on the day of the most recent accident, or did you not use a restraint device?

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

Q27. Were you wearing a fall-restraint device (such as a safety belt, harness, etc.) while climbing into the elevated hunting stand during the most recent accident? (Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

Q28. Were you wearing a fall-restraint device while in the elevated hunting stand during the most recent accident? (Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

**Q33. What were you doing at the time of the most recent accident?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q33. What were you doing at the time of the most recent accident?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q33. What were you doing at the time of the most recent accident?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q36. Did the most recent accident occur while you were shooting at game?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q60. Please tell me if any of the following may have contributed to the most recent accident?
 (Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a ladder stand)**

**Q78. Please tell me if any of the following may have contributed to the most recent accident?
 (Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a fixed position stand)**

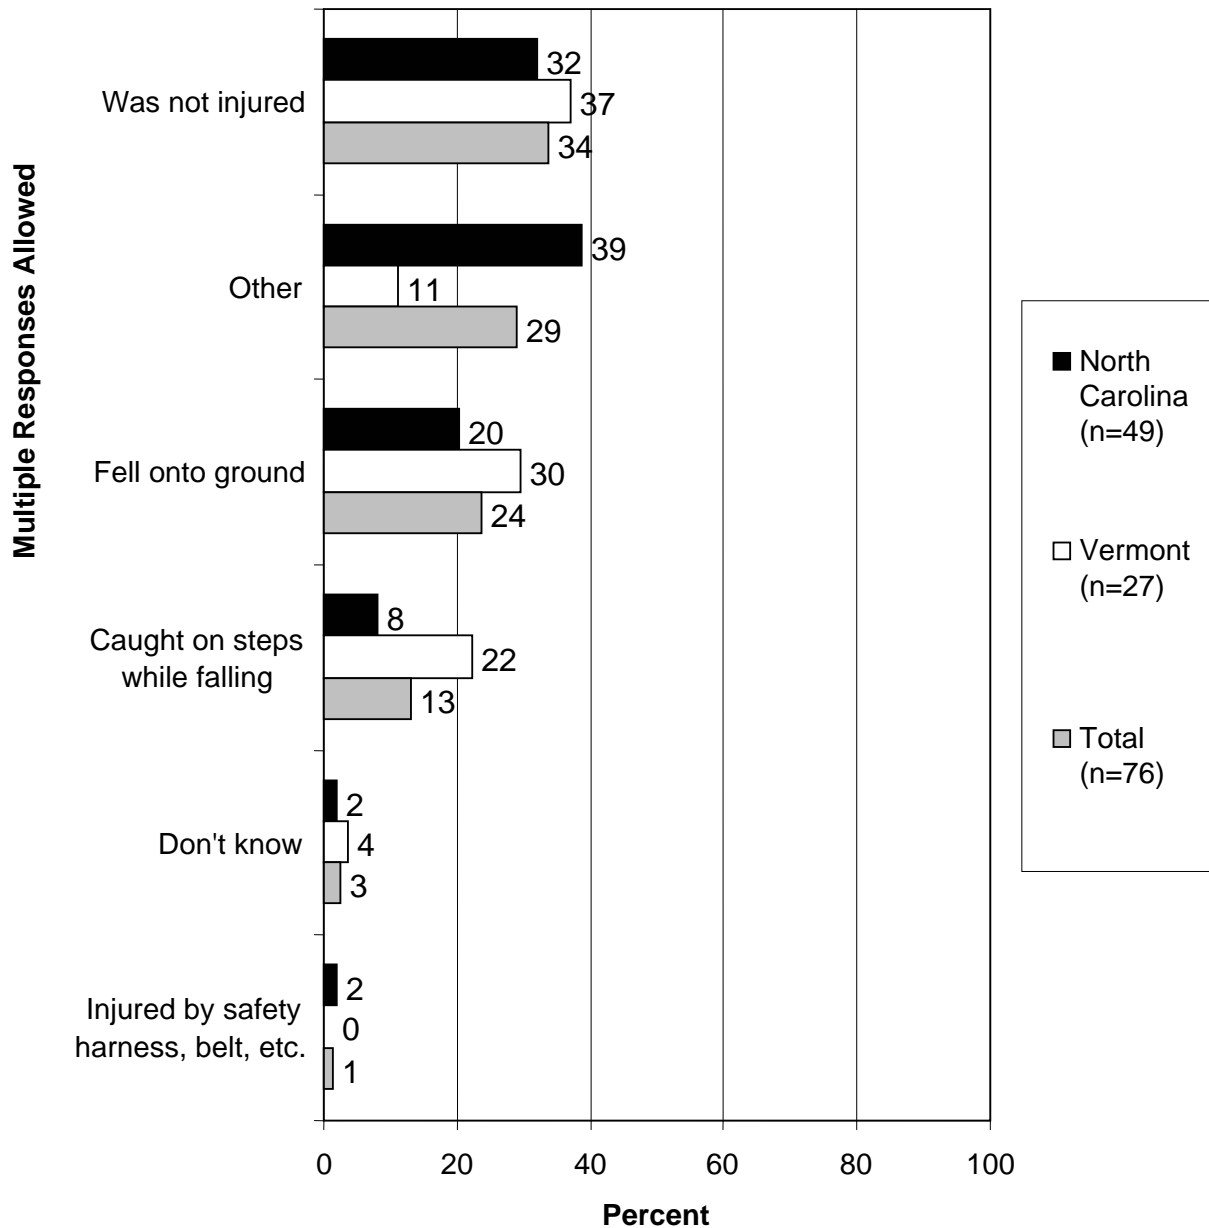

**Q95. Please tell me if any of the following may have contributed to the most recent accident?
 (Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a climbing elevated hunting stand)**

**Q109. Please tell me if any of the following may have contributed to the most recent accident?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a tripod or quad stand)**

**Q40. Please describe the direct causes of your injury during the most recent accident.
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q45. How high were you when the most recent accident occurred?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

Q53, Q69, Q86, & Q103. Was there a type of safety or shooting rail around the stand (most recent accident)?

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

Q47, Q62, Q80, & Q97. elevated hunting stand fabrication, most recent accident ("others" and "don't knows" eliminated).

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

Q47, Q62, Q80, & Q97. Elevated hunting stand materials, recent accident ("others" and "don't knows" most eliminated).

(Asked of those who indicated that they had experienced an elevated stand accident in the past 10 years)

Q47, Q62, Q80, & Q97. Elevated hunting stand fabrication and materials, most recent accident ("others" and "don't knows" eliminated).

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

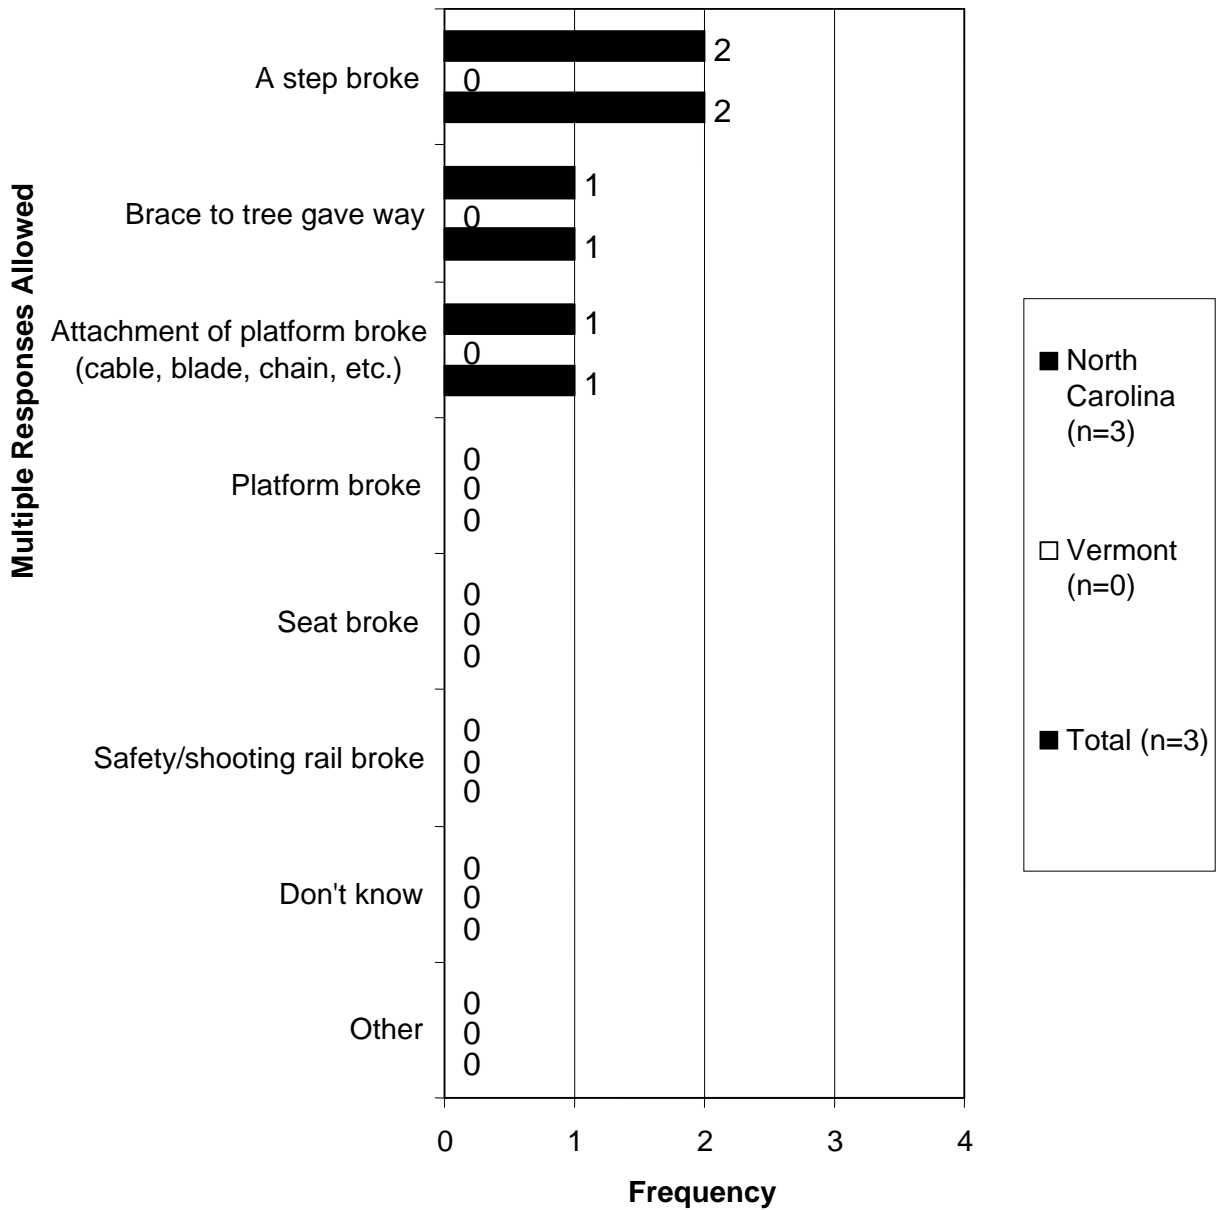

Q49, Q65, Q82, & Q99. Was the elevated hunting stand defective (most recent accident)?

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

Q51. In what way was the ladder elevated hunting stand defective (most recent accident)?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a ladder stand)

Q64. Was the fixed position stand a permanent or portable (hang-on type) stand (most recent accident)?

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a fixed position stand)

Q67. In what way was the fixed position elevated hunting stand defective (most recent accident)?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a fixed position stand)

Q72. What types of steps were used for access into the elevated hunting stand (most recent accident)? (Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a fixed position stand)

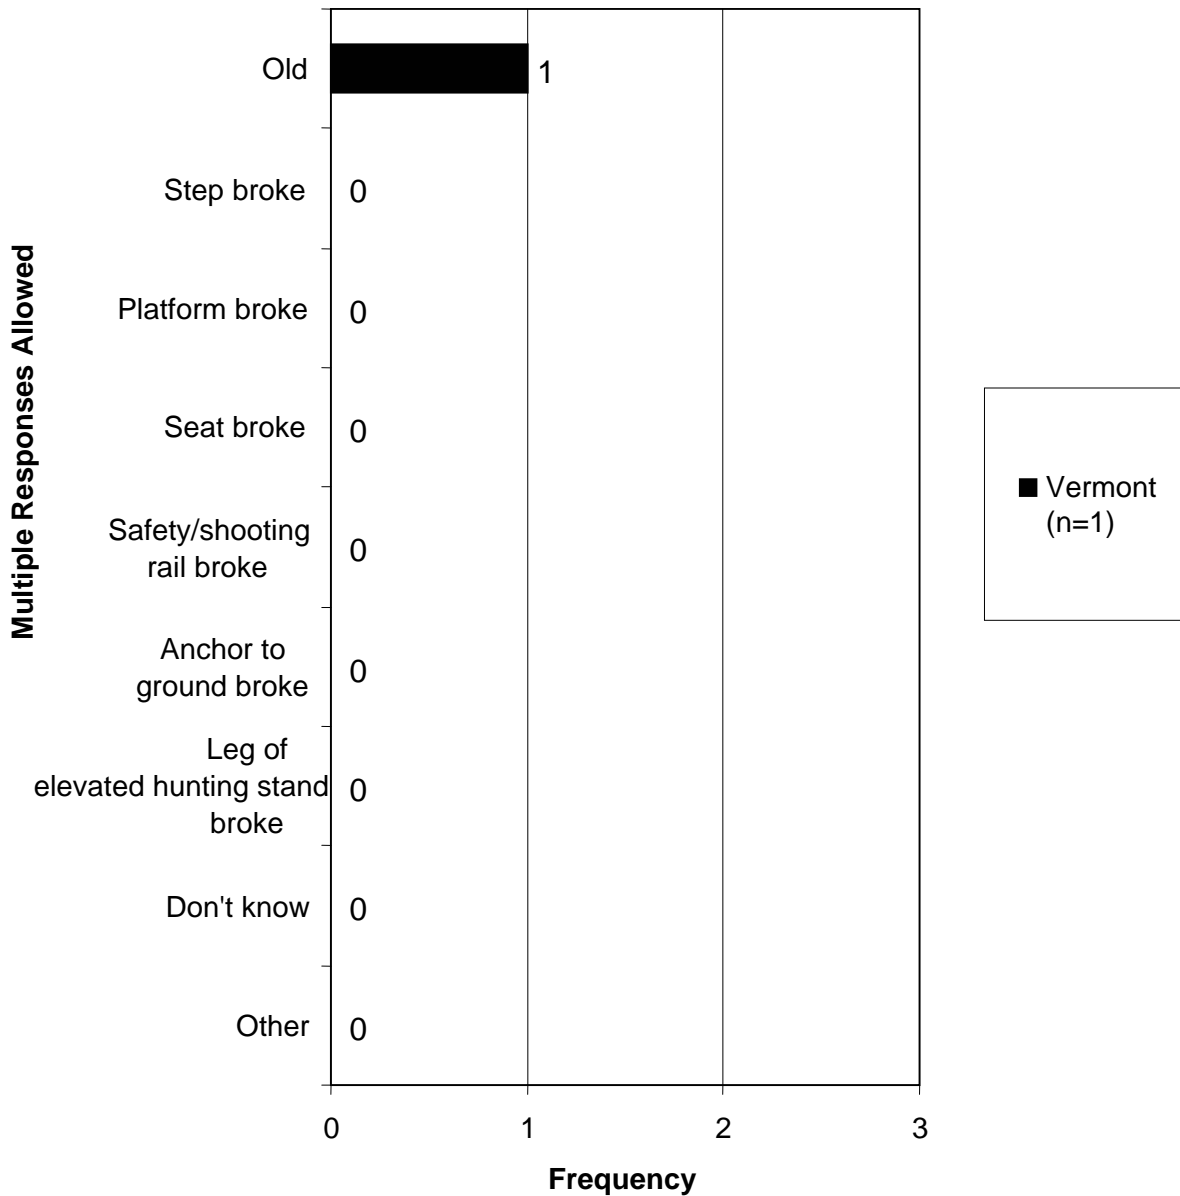

**Q84. In what way was the climbing elevated hunting stand defective (most recent accident)?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a climbing elevated hunting stand)**

Q89. In what position were you when the accident occurred (most recent accident)?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a climbing elevated hunting stand)

**Q101. In what way was the tripod or quad elevated hunting stand defective (most recent accident)?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had used a tripod or quad stand)**

Q54, Q70, Q87, & Q104. Type of elevated hunting stand attachment (most recent accident).
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

PRECAUTIONS TAKEN BEFORE ACCIDENT AND BEHAVIORS AFTER ACCIDENT

For Questions 22-116, respondents discussed their most recent accident, which for most was their only accident. Therefore, all statistics in the following section do not include the second accident that 6 hunters had experienced.

Q29. Most hunters (54%) who had been involved in an elevated hunting stand accident felt that they may not have taken as many precautions as they could have to prevent the accident.

Q31. Those who indicated that they may not have taken as many precautions as they could were asked to give the reason for not taking as many precautions as they could: 33% said that they didn't think about it, and 21% said time/hassle.

Q112. A slight majority (53%) of hunters who had been involved in an elevated hunting stand accident had read the instructions regarding the use of the stand; 43% had not read the instructions.

Q113. Most hunters (74%) who had been involved in an elevated hunting stand accident changed their habits or hunting techniques as a result of the accident. However, 25% said that they had not changed their habits or hunting techniques. Only 1 hunter, from North Carolina, had quit hunting altogether.

Q115. Of those who said that their accident had caused them to change their habits or hunting techniques, 52% said they simply exercise more caution while in the elevated hunting stand, 34% said they now wear a fall-restraint device, and 29% said they now use a different type of elevated stand.

**Q29. Do you feel you took as much precaution as you could to prevent the most recent accident?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

Q31. What are the main reasons you do not take greater safety precautions while using an elevated hunting stand?

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and had not taken adequate precautions to prevent the fall)

**Q112. Did you read the instructions regarding the use of the stand, if provided?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q113. How did your most recent accident affect your hunting behavior? Would you say that it had no effect on your habits or hunting techniques, that it caused you to change your habits or hunting techniques, or that it caused you to quit hunting?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

Q115. In what way did the most recent accident cause you to change your hunting habits or techniques?

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years and that the accident had caused them to change their behavior)

CONDITIONS AT TIME OF ACCIDENT

For Questions 22-116, respondents discussed their most recent accident, which for most was their only accident. Therefore, all statistics in the following section do not include the second accident that 6 hunters had experienced.

Q35. The majority of accidents occurred on private land (78%).

Q37 and Q38. One might expect that most accidents occurred in less-than-optimal conditions (dim light, rainy weather); however, the survey results show that 50% of accidents occurred in daylight, and 70% occurred in clear weather. Only 16% of accidents occurred in darkness, and only 21% occurred in wet/rainy conditions.

**Q35. Did the most recent accident occur on public or private land?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

**Q37. What were the light conditions at the time of the most recent accident?
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

Q38. What were the weather conditions at the time of the most recent accident?

(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

CHARACTERISTICS OF HUNTERS WHO HAD BEEN IN AN ACCIDENT

For Questions 22-116, respondents discussed their most recent accident, which for most was their only accident. Therefore, all statistics in the following section do not include the second accident that 6 hunters had experienced.

Q56, Q74, Q91, and Q105. The mean height of hunters who had been involved in an elevated stand accident was just under 5' 11" for North Carolina hunters, just under 5' 10" for Vermont hunters, and just over 5' 10" for hunters as a whole.

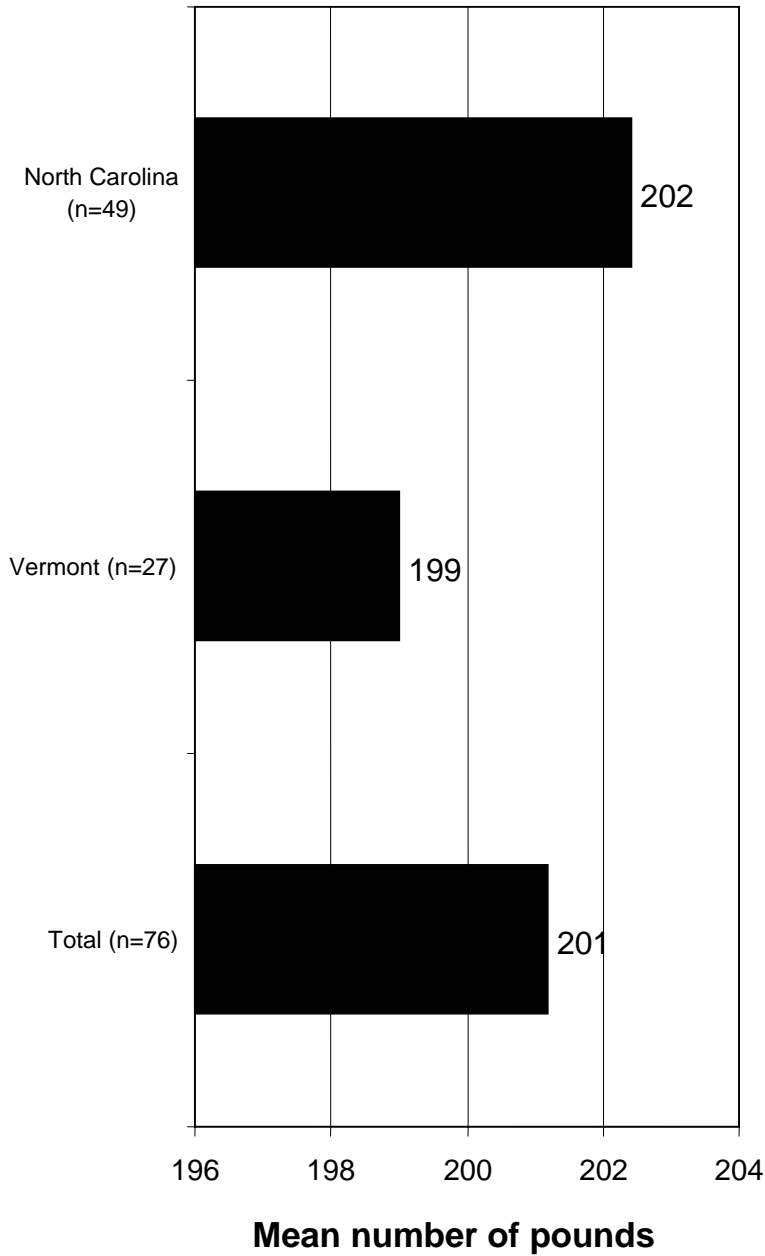

Q57, Q75, Q92, and Q106. The mean weight of hunters who had been involved in an elevated stand accident was 202 pounds for North Carolina hunters, 199 pounds for Vermont hunters, and 201 pounds for hunters as a whole.

Q58, Q76, Q93, and Q107. The mean age of hunters who had been involved in an elevated stand accident was 31 years for North Carolina hunters, 36 years for Vermont hunters, and 33 years for hunters as a whole.

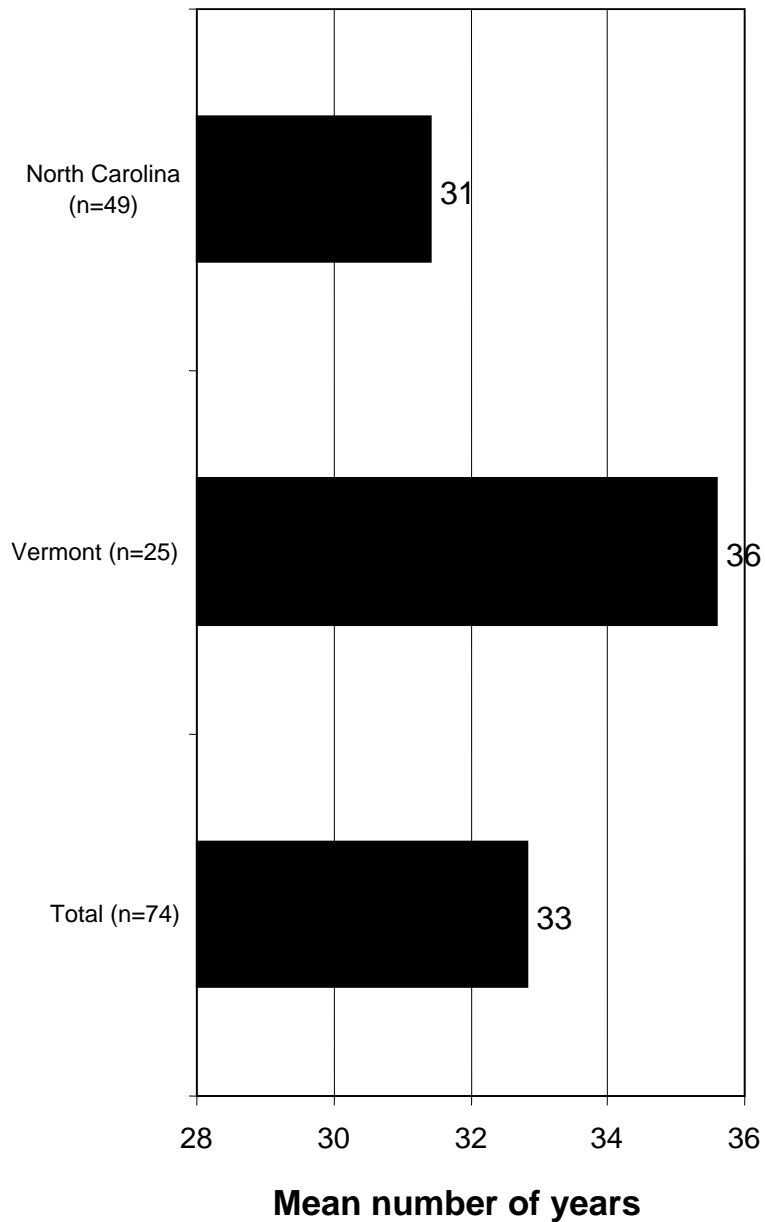

**Q56, Q74, Q91, & Q105. Hunter's height (in inches)
at the time of the most recent accident.
(Asked of those who indicated that they had
experienced an elevated hunting stand accident in
the past 10 years)**

Q57, Q75, Q92, & Q106. Hunter's weight (in pounds) at the time of the most recent accident. (Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)

**Q58, Q76, Q93, & Q107. Hunter's age (in years) at the time of the most recent accident.
(Asked of those who indicated that they had experienced an elevated hunting stand accident in the past 10 years)**

SECOND ACCIDENT

Q117-Q210. As mentioned previously, there were 6 hunters who had experienced two accidents within the previous 10 years. The graphs for the second accidents are shown on the following pages. There were no hunters who had experienced more than two accidents in the previous 10 years.

Q117. Did your second accident require any professional medical treatment, treatment by someone other than a medical professional, or were you not injured in the accident? (Asked of those who had experienced more than one accident in the past 10 years)

**Q118. In what year did your second accident occur?
(Asked of those who had experienced more than one accident in the past 10 years)**

**Q119. Please identify the hunting equipment you were using at the time of your second accident.
(Asked of those who had experienced more than one accident in the past 10 years)**

Q120. What kind of fall-restraint device did you use on the day of your second accident, or did you not use a restraint device? (Asked of those who had experienced more than one accident in the past 10 years)

Q122. Were you wearing a fall-restraint device (such as a safety belt, harness, etc.) while climbing into the elevated hunting stand during your second accident? (Asked of those who had experienced more than one accident in the past 10 years)

Q123. Were you wearing a fall-restraint device while in the elevated hunting stand during your second accident? (Asked of those who had experienced more than one accident in the past 10 years)

Q124. Do you feel you took as much precaution as you could to prevent your second accident? (Asked of those who had experienced more than one accident in the past 10 years)

**Q126. What are the main reasons you do not take greater safety precautions while using an elevated hunting stand?
(Asked of those who had experienced more than one accident in the past 10 years and who said they had not taken enough precautions)**

Q128. What were you doing at the time of your second accident? (Asked of those who had experienced more than one accident in the past 10 years)

Q130. Did your second accident occur on public or private land? (Asked of those who had experienced more than one accident in the past 10 years)

Q131. Did your second accident occur while you were shooting at game? (Asked of those who had experienced more than one accident in the past 10 years)

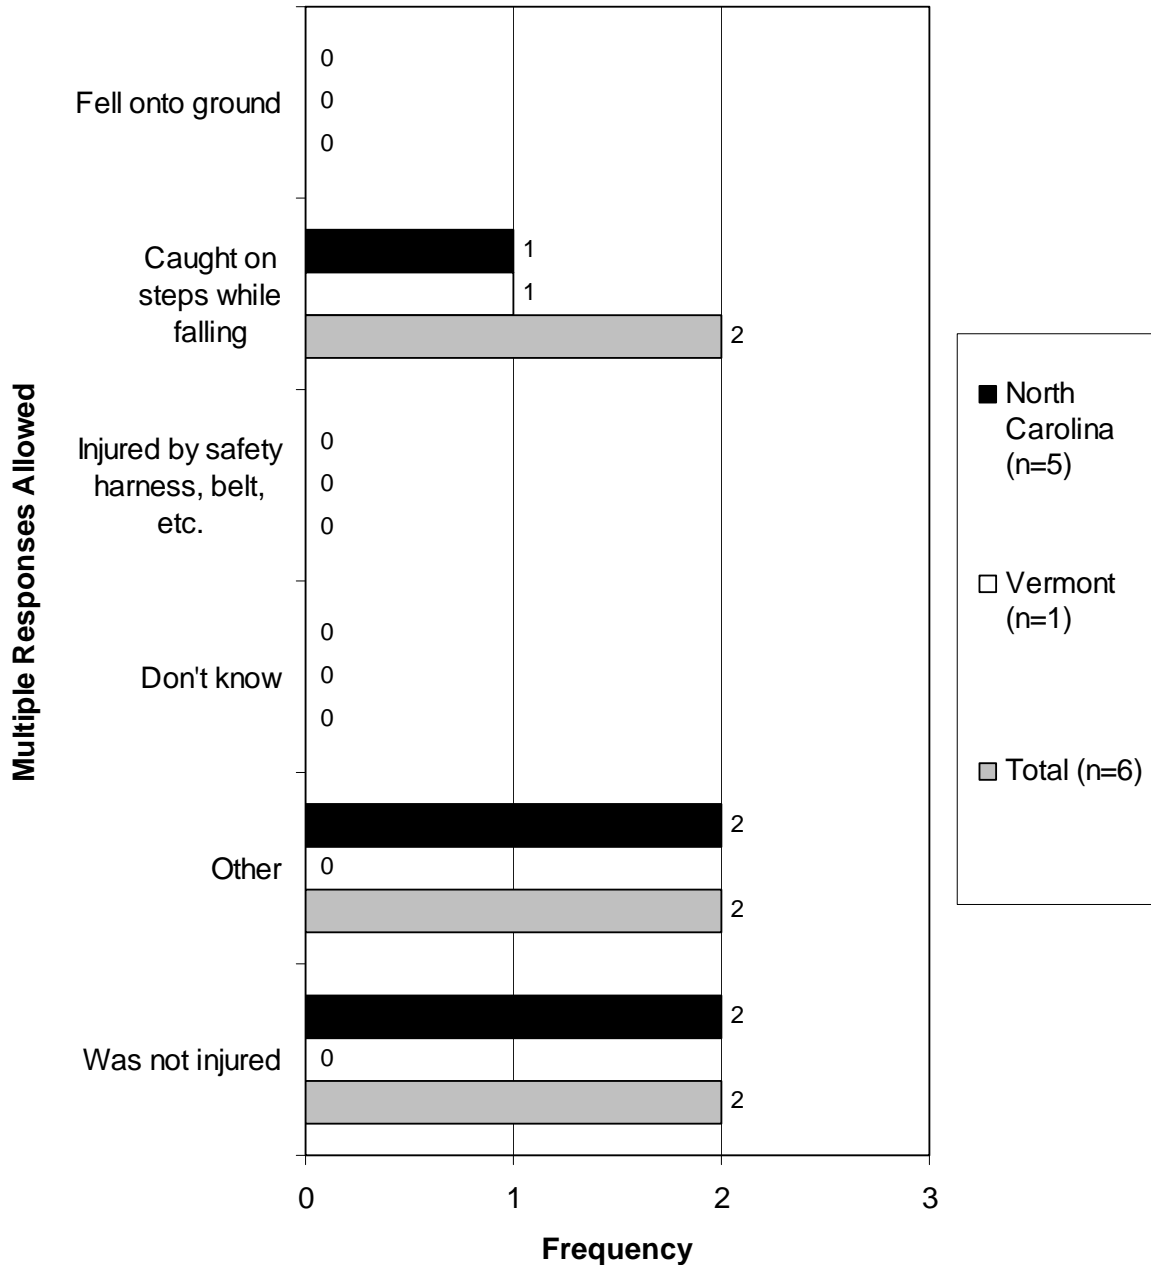

Q132. What were the light conditions at the time of your second accident? (Asked of those who had experienced more than one accident in the past 10 years)

Q133. What were the weather conditions at the time of your second accident? (Asked of those who had experienced more than one accident in the past 10 years)

Q135. Please describe the direct causes of your injury during your second accident. (Asked of those who had experienced more than one accident in the past 10 years)

Q140. How high were you when your second accident occurred? (Asked of those who had experienced more than one accident in the past 10 years)

Q141. What type of elevated hunting stand were you using when your second accident occurred? (Asked of those who had experienced more than one accident in the past 10 years)

**Q207. Did you read the instructions regarding the use of the stand, if provided (second accident)?
(Asked of those who had experienced more than one accident in the past 10 years)**

Q208. How did your second accident affect your hunting behavior? Would you say that it had no effect on your habits or hunting techniques, that it caused you to change your habits or hunting techniques, or that it caused you to quit hunting?
(Asked of those who had experienced more than one accident in the past 10 years)

**Q210. In what way did your second accident cause you to change your hunting habits or techniques?
(Asked of those who had experienced more than one accident in the past 10 years and who had changed their hunting technique as a result)**

DEMOGRAPHIC CHARACTERISTICS OF SAMPLE

The age categories of all respondents are shown in the graph that follows. In addition, the respondents were overwhelmingly male (97%).

Q307. Respondent's age.

Q309. Respondent's gender (not asked, but observed by interviewer).

ADDITIONAL COMMENTS

Q308. That's the end of the questionnaire, thank you very much for your time and cooperation!

Advice: use good elevated stands and harnesses.
Can we raise the limit on deer?
Concerned that Fish and Wildlife Department is taking their eye off the ball; they should be doing monitoring violators.
Everyone should be prepared before going into the woods.
Accidents result because hunters don't think it will happen to them.
Extend respect to hunters, [who are] good sportsmen, conservation-minded, restoration minded. Wildlife commission [should] work with hunters.
I dislike the rule that you can't use a chain while using elevated hunting stands.
They need to make better safety harnesses.
Alcohol is a big factor in elevated hunting stand accidents.
I would like to pursue finding a copy of my hunter safety card. Any assistance is grateful.
People should get the right equipment and understand it.
Concerned about roadside hunting, not safe.
Increase of hunters is reason for increase in accidents.
Just be smart.
More people need to use their elevated stand harnesses.
There should be a law requiring the use of a leash if there is not one already.
North Carolina is doing a good job at getting information out regarding elevated hunting stand safety; need more hunter safety courses for new hunters.
People need to be careful whom they hunt with.
I wish people would be safe.
People need to spend more time planning for safety.
Wildlife management in North Carolina is not very good.
People should take safety courses and wear belts at all times.
Q38. Windy.
Some folk aren't themselves, let their hunting overrule their judgment.
People need to take hunter safety courses.
Unload gun before get down and carry a rope. Be careful.
The diseases the northerns have, a bacteria: exactly what should we do with the fish we catch with that type of disease?
The problem is that people don't care, and there aren't enough good educators to make them care.
The elevated stand company was sued because of defective equipment.
Use common sense while hunting.

APPENDIX A: INDIVIDUAL GRAPHS THAT WERE COMBINED IN SURVEY RESULTS

**Q47. What was the construction of the ladder stand (most recent accident)? Was it...?
 (Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a ladder stand)**

Q49. Was the ladder treestand defective (most recent accident)?

(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a ladder stand)

Q53. Was there any type of safety or shooting rail around the stand (most recent accident)?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a ladder stand)

**Q54. How was the platform on top of the ladder stand attached to the tree (most recent accident)?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a ladder stand)**

**Q62. What was the construction of the fixed position stand (most recent accident)? Was it...?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a fixed position stand)**

Q65. Was the fixed position treestand defective (most recent accident)?

(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a fixed position stand)

Q69. Was there any type of safety or shooting rail around the stand (most recent accident)?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a fixed position stand)

Q70. How was the permanent stand attached to the tree (most recent accident)?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a fixed position stand)

**Q80. What was the construction of the climbing stand (most recent accident)? Was it...?
 (Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a climbing treestand)**

Q82. Was the climbing treestand defective (most recent accident)?

(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a climbing treestand)

Q86. Was there any type of safety or shooting rail around the stand (most recent accident)?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a climbing treestand)

Q87. How was the climbing stand attached to the tree (most recent accident)?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a climbing treestand)

**Q97. What was the construction of the tripod or quad stand (most recent accident)? Was it...?
 (Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a tripod or quad stand)**

Q99. Was the tripod or quad treestand defective (most recent accident)?

(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a tripod or quad stand)

Q103. Was there any type of safety or shooting rail around the stand (most recent accident)?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a tripod or quad stand)

Q104. Was the stand anchored into the ground or into a tree (most recent accident)?
(Asked of those who indicated that they had experienced a treestand accident in the past 10 years and had used a tripod or quad stand)
